Cryogenic processes differ from general chemical processes in several ways. The use of multistream heat exchangers with internal pinch points makes it necessary to use somewhat different approaches to simulate mixed refrigerant processes. Mixed refrigerants were first employed in large scale cryogenic systems, particularly in the liquefaction of natural gas. More recently, significant work has been done in using mixed refrigerants in small cryocoolers. Mixed refrigerant cycles are the subject of extensive ongoing research.

Mixed refrigerant processes were subsequently adopted for the commercial liquefaction of natural gas nearly 40 years ago. Over 95% of the base-load LNG plants operate on mixed refrigerant processes, with the remaining few operating on conventional cascade processes.

Dual mixed refrigerant (DMR) process. Dual MR processes are offered by Shell and APCI. The Shell process has been proven in Sakhalin, while the APCI process has been qualified by most major international oil companies. This process uses two separate MR cooling cycles—one for precooling the gas and one for final cooling and liquefaction.
