### Latent Semantic Mapping Principles And

Latent semantic mapping (LSM) is a generalization of latent semantic analysis (LSA), a paradigm originally developed to capture hidden word patterns in a text document corpus. In information retrieval, LSA enables retrieval on the basis of conceptual content, instead of merely matching words between queries and documents.

### Latent Semantic Mapping: Principles and Applications ...

Latent semantic mapping (LSM) is a data-driven framework to model globally meaningful relationships implicit in large volumes of (often textual) data. It is a generalization of latent semantic analysis. In information retrieval, LSA enables retrieval on the basis of conceptual content, instead of merely matching words between queries and documents.

Ever since, these techniques for co-word mapping have been further developed, for example, into Latent Semantic Analysis (e.g., Landauer et al., 1998; Leydesdorff, 1997). These methods operate on a word-document matrix in which the documents can be considered as providing the cases (e.g., rows) to which the words are attributed as variables (columns).

### The semantic mapping of words and co-words in contexts

Latent semantic indexing. Latent semantic indexing (LSI) is an indexing and retrieval method that uses a mathematical technique called singular value decomposition (SVD) to identify patterns in the relationships between the terms and concepts contained in an unstructured collection of text. LSI is based on the principle that words that are used in the same contexts tend to have similar meanings.
