### Pendulum Clock Gizmo : Lesson Info : ExploreLearning

Explanation: If a pendulum clock is running too slow, the period of its pendulum must be too long. The period is mostly determined by the length of the pendulum. The period increases as the pendulum gets longer, and decreases as it gets shorter. Therefore, making the pendulum shorter will speed up the clock.

The period of swing of a pendulum depends primarily on its length, and the acceleration of gravity. It is independent of the mass of the bob. The reason for this is that the period depends on the maximum velocity at the lowest point (where KE is the greatest), and in turn the maximum velocity depends only on the height at the highest point.
