Where reliability is concerned, engineers and safety professionals are concerned with the likelihood of a failure event not occurring, which, is opposite to safety management where the focus on a safety event or failure is its' likelihood that it will occur.

The approach integrates two main criteria in the planning process: structural reliability and whole life cycle cost. The probability of failure due to corrosion induced deflection, buckling, wall thrust and bending stress is estimated and then the study is extended to minimize the risk and life cycle cost optimization using GA.

Definition of Risk Related to Reliability

Probabilistic risk assessment has created a close relationship between safety and reliability. Component reliability, generally defined in terms of component failure rate, and external event probability are both used in quantitative safety assessment methods such as FTA.
